

Amendments to the Specification:

Please replace the paragraph beginning at page 4, line 18, with the following rewritten paragraph:

Ribs or grooves 18 are formed on the wall of the cavity in each spindle and cooperate with ribs or grooves on the hub 13. Thus, a multi-point coupling (preferably having three or more point, line and/or surface contacts) is obtained between the hub 13 and the spindle 6 to transmit the rotary movement of the toothed rim 7 to the coupling end 27 of the spindle 6. The spindle 6 may be tilted relative to the toothed rim to accommodate to the position of the center of the cutting member 5 relative to the axis of rotation 20 of the toothed rim 7, for instance to assume a position that is slightly angled relative to the axis of rotation 20 of the toothed rim 7

After the paragraph ending at page 3, line 19, please add the following new paragraph:

Fig. 6 is a somewhat schematically front elevation of a shaving apparatus according to an embodiment of the invention having more than three floating heads.
